San Antonio, TX

SUMMARY

Technical Project Manager with over 15 years of experience delivering complex technology solutions for global clients across Retail, Government & Public Sector, and Insurance industries. Proven track record in leading end-to-end project execution, driving operational excellence through DevOps practices, release management, and AWS cloud adoption. Demonstrated success in managing cross-functional, globally distributed teams and consistently delivering complex projects in enterprise environments.

KEY ACHIEVEMENTS

Technical Discussions Impact

Technical discussions resulting in a 40% decrease in deployment time for cloud projects.

Migration Planning Success

Implemented migration planning that improved release agility by 60% across 15 departments.

EXPERIENCE

DevOps Cloud Manager

Teradyne Infotech

Farmington Hills, MI

04/2024 - 12/2025

Entuber SAP support team had multiple SAP consultants working across different client environments. However, we lacked a centralized system to track internal support tickets. This led to delays, lack of visibility, and inconsistencies in how incidents were managed and resolved.

Responsibility:

Assigned to lead an internal initiative to build and deploy a robust support ticketing system that would improve collaboration, streamline incident tracking, and provide quick visibility into ticket resolution progress.

Action:

Collaborated with the SAP consultants to understand their pain points and designed a custom ticketing tool built in Java. Took care the full ownership of the DevOps and deployment lifecycle:

- Built a CI/CD pipeline using AWS CodePipeline, CodeBuild, and CodeDeploy to automate the build and deployment process.
- Containerized the application with Docker and deployed it on Amazon EKS, ensuring scalability and high availability.
- Used Terraform and AWS CloudFormation to provision infrastructure as code, making the environment setup consistent across dev, staging, and production.
- Maintained close collaboration with users to incorporate feedback quickly through the pipeline.

Deliverable:

The new tool significantly improved internal operations — enabling faster ticket resolution, better cross-team visibility, and proactive incident management. The project also helped mature our DevOps capabilities and served as a model for future internal tooling.

DevOps Manager

EY

India

05/2022 - 2023

At P&G, around 10-12 departments were independently working on tools hosted on a shared PHP-based platform, each with separate backlogs and Scrum teams. The lack of a unified DevOps approach, combined with multiple vendors, led to inconsistent deployments, unclear ownership, environment issues, and frequent delivery delays. Worked with all the retail value chain departments including procurement, logistics, distribution, and warehousing in P&G.

Responsibility:

After consolidation under a single vendor, responsibility expanded for bringing structure to delivery, improving release reliability, and defining a scalable modernization and DevOps-driven migration strategy aligned with business goals.

Action:

- Retained separate Product Backlogs for each department to preserve domain clarity, while introducing a structured backlog review cadence with stakeholders to prioritize based on business value and technical feasibility.
- At the same time, initiated the transition from a monolithic PHP system to a microservices-based architecture using ReactJS and Node.js, identifying modules for phased decomposition.
- To support this transformation, worked closely with development and DevOps teams to standardize deployment practices by containerizing services using Docker and deploying them on AWS EKS. Led the setup of CI/CD pipelines using GitHub Actions, enabling consistent build, test, and release processes across teams.
- Aligned teams on cloud infrastructure usage, including S3 for static content, RDS (MySQL) for data management, and CloudWatch for centralized logging and monitoring, while improving coordination between development, infrastructure, and operations teams.

Deliverable:

This integrated approach reduced story conflicts and sprint spillovers, while significantly improving release stability and delivery velocity. The DevOps standardization led to a 60% improvement in release agility and more consistent environments across teams. In parallel, the modernization initiative established a clear, phased migration path toward a scalable, cloud-native architecture aligned with long-term business objectives.

Agile Consultant, Technical Manager

India

EY

10/2012 - 2022

A large-scale program to modernize the HR systems for the Dubai Government. The architecture involved integrating multiple departmental systems — like Purchase, Reporting, and Business Rules — through an Enterprise Service Bus. Joined as the Cloud Managed Services Lead, responsible for the deployment phase after integration.

Responsibility:

However, the integration stream started facing delays due to gaps in cross-team coordination and missing dependencies across various departmental streams. My task shifted to helping resolve these blockers and ensuring smoother delivery.

Action:

- Actively collaborating with the Integration stream's Scrum team, identifying and analyzing the missing touchpoints and system interactions. But quickly realized that many dependencies were undocumented across teams. So, initiated regular cross-stream syncs, aligned backlogs, and ensured dependency stories were clearly mapped across departments.
- Supported with standardize story tracking using Azure DevOps, ensuring each team's backlog was visible and properly linked for dependency tracking. Gradually, entrusted with program-level coordination, leading all the streams to work in sync, while continuing to oversee deployment readiness from a cloud perspective.

Deliverable:

This proactive approach helped reduce integration delays, increased transparency across streams, and brought the program back on track. The use of Azure DevOps helped streamline delivery and improved stakeholder confidence. Eventually transitioned from a deployment -lead to a program-level coordinator, balancing both technical alignment and delivery outcomes.

Technical Manager, Scrum Master

India

UST

08/2005 - 09/2012

Worked with UST across multiple client engagements including Equifax and AAA, supporting large-scale enterprise applications undergoing modernization. At Equifax (post TALX acquisition), over 20 critical applications required ongoing support, SLA compliance, and gradual replacement of legacy systems. At AAA, the e-commerce platform was built on legacy ASP with heavy third-party dependencies, limiting scalability and maintainability.

Responsibility:

Responsible for ensuring stable delivery and SLA adherence for multiple applications, while leading transition and migration initiatives to modern architectures. This included managing large teams, streamlining support models, and defining technical roadmaps for legacy modernization.

Action:

- At Equifax, managed support and development for 20+ applications under a Managed Services model, while introducing a structured Transition Methodology to onboard and stabilize two projects within a defined three-month plan. Led and mentored a team of around 50 members, ensuring alignment with MVC-based architecture and maintaining SLA commitments through effective planning and coordination.
- In parallel, at AAA (ACSC), led the migration of a legacy ASP-based e-commerce platform to .NET 2.0 by analyzing existing dependencies, removing COM components, and redesigning the system into an N-tier architecture. Created a detailed migration roadmap, guided a team of 25+ members through execution using SDLC practices, and contributed to framework design, development, and testing.

Deliverable:

Successfully stabilized and improved SLA adherence across multiple applications at Equifax, while enabling smooth transition of projects with minimal disruption. At AAA, delivered a modernized, scalable .NET-based platform within timelines, reducing system complexity and improving maintainability, while strengthening team capability and delivery consistency.

SKILLS

Cloud services: AWS-ECS, CloudFormation, IAM, EC2, CodePipeline, VPC, Load Balancing, Containers-Docker
Programming Skills: Shell Script, YAML, Bash
Tools: MSProject, Asana, Docker, Kubernetes, Ansible, ArgoCD, Jenkins, Git, Linux, Helm

EDUCATION & CERTIFICATIONS

M.S. Computer Science – Periyar University, India

B.S. Computer Science – University of Kerala, India

Project Management Professional (PMP) – PMI, 2012

AWS Cloud Architect Associate - AWS, 2023

SAFe Agilist – Scaled Agile Inc. 2021

Certified Kubernetes Administrator (CKA) - LNFC, 2024
